Preparation and Characterisation of $N^2,N^4$-Dialkyldiene
Hydrazidines

PALLE JAKOBSEN

Medicinsk-Kemisk Institut, University of Copenhagen, Rådmandsgade 71, DK-2200 Copenhagen, Denmark

The reactions between hydrazones and aliphatic thioacid-O-esters have been investigated. Substituted benzophenone hydrazones form $N^2,N^4$-dialkyldiene hydrazidines with high yields, while the main product from the reactions with aliphatic hydrazones are the corresponding azines. $^1$H NMR, IR, MS, and in two cases $^{13}$C NMR spectra have been recorded.

In the literature it has been established that $N$-substituted thiodyhydrizides are stable, while the aliphatic $N$-unsubstituted thiodyhydrizides are unstable, but the aromatic ones stable. Attempts to prepare the benzylidene derivative of a thiodyhydrizide by reaction of dithioesters with benzalhydrazone has been reported as unsuccessful. Mayer and Orgis demonstrated the efficiency of O-ethyl thioformate in the preparation of thioformanamide and later Walter showed that O-ethyl thioformate could be used in the preparation of $N$-substituted thioform-hydrizides. The purpose of this investigation was to try to prepare the alkylidene derivatives of thioformhydrizides by the reaction of O-ethyl thioformate with hydrazones. It turned out, however, that equimolar amounts of hydrazone and O-ethyl thioformate gave $N^3,N^4$-dialkyldiene formohydrazone hydrazones (I) as the main product under conditions suitable for thioformylation of hydrazines.

\[
\begin{align*}
R - C & \overset{\text{S}}{\text{O}}_2H & R' \overset{\text{C}=\text{NH}_2}{} & \rightarrow \\
R^1 & \overset{\text{C}=\text{N}-\overset{\text{N}\text{H}_2}{} & R^2
\end{align*}
\]

Several hydrazidines have been reported as unstable intermediates in formazane formation but no dialkyldiene derivatives have been reported in the literature. Therefore, a closer investigation of the chemical and physical properties of I was carried out.

O-Ethyl thioformate and an $N$-unsaturated benzophenone hydrazone in benzene or ethanol solution react at room temperature under instantaneous evolution of hydrogen sulfide. Reasonable yields of the hydrazidine derivatives (I) can be isolated after stirring for few hours (Table 1).

Mixtures of products are obtained if the reactions are carried out under cooling. It is clear from the IR and $^1$H NMR spectra of these mixtures that one of the components is the expected hydrazidine derivate. One of the other components has spectroscopical properties that might fit a thioformylated hydrazone. Attempts to isolate the components by preparative layer chromatography gave no thioformylated hydrazone.

The reaction was carried out with hydrazones of aliphatic, aromatic, and mixed aliphatic-aromatic ketones. With aliphatic hydrazones the corresponding azine was the main product and no hydrazidine was isolated. This is in accordance with the wellknown instability of aliphatic hydrazones and with results of other reactions with hydrazones.

Mixtures of the corresponding azine and the hydrazidine (I) were formed when acetophenone hydrazone or dibenzylketone hydrazone were reacted with O-ethyl thioformate. In the latter case the two compounds were separated by PLC.
To investigate if thioacylated hydrazone of other aliphatic thioacids could be formed, some experiments were carried out with 0-ethyl thioacetate. The hydrazidine derivative was the main product and no thioacylated hydrazone was isolated.

It has been stated in the literature that it is necessary to use pure 0-ethyl thioformate to obtain a reasonable yield in the thioformylation reactions. It was found in this investigation that 0-ethyl thioformate triple-distilled under nitrogen, was not pure. The best yields were obtained from freshly prepared 0-ethyl thioformate distilled once under nitrogen.

Some chemical properties of compound Ia were investigated. Thus methylation with methyl iodide and dimethyl sulfate and acetylation with acetic anhydride were attempted, but no methylated or acetylated product was isolated. From an attempted hydrolysis in excess 1 M NaOH the starting materials were recovered after 12 h reflux. Hydrolysis in excess 1 M HCl gave benzophenone and benzophenone azine, identified by m.p., IR and MS. A quantitative experiment using excess 1.000 M HCl and titration with 1.000 M NaOH showed that one equivalent of HCl was consumed, which is in accordance with the proposed formula for Ia.

The structure of I was based on spectroscopic evidence. The 1H NMR spectra of compounds Ia–e taken in deuterochloroform showed CH signals as doublets in the region δ 7.62–7.80 and NH signals as broad doublets in the region δ 9.0–9.5. By shaking with deuterium oxide the signals at δ ~9 disappeared and the doublets at δ ~7.7 collapsed. This proves that the CH and NH protons are placed at atoms which are neighbours, as in structure I. The same was shown by spin decoupling experiments. The phenyl protons gave complex signals in the region δ 6.9–7.8. For compounds If and Igl the NH and CH3 signals were singlets in accordance with the hydrazidine structure.

13C NMR spectra were recorded for compounds Ia and Ib. These support the structure I, showing four quaternary carbon atoms and three C=N carbon atoms one of which is attached to hydrogen for compound Ia. The 13C NMR spectra give no indication as to whether the compounds obtained are mixtures of Z and E forms or only one of the isomers.

The infrared spectra exhibited NH stretch absorptions in the region 3295–3382 cm⁻¹, and several bands in the region 3085–3020 cm⁻¹.
cm⁻¹. (the aromatic protons and the hydrogen attached to CN double bond). In the region 1638 – 1580 cm⁻¹ two to three strong and broad absorption-bands were found which possibly arise from C=N-stretching and the aromatic skeletal vibrations. This region seems to be in accordance with that quoted in Bellamy. Some other characteristic absorptions are given in the experimental part.

The mass spectra all gave a molecular ion corresponding to the actual molecular weight (variable intensity 0.2 – 26 % of base peak). The fragmentation pattern is in accordance with structure I.

EXPERIMENTAL

Microanalyses were carried out in the microanalysis department of Chemical Laboratory II, the H. C. Ørsted Institute. ¹H NMR spectra were obtained on a Varian A-60 or a JEOL JNM-MH 60/II instrument with TMS as internal reference. IR spectra were recorded on a Perkin-Elmer model 225 grating spectrophotograph. Mass spectra were taken on a Finnegan 1015 S/L or an AEI-902 instrument operating at 70 eV. ¹³C NMR spectra were recorded on a Bruker WH 90 instrument. Melting points were taken on a Büchi melting point apparatus and are uncorrected.

O-Ethyl thioformate was prepared according to the literature.

O-Ethyl thioacetate. This compound was prepared from ethyl acetoacetate hydrochloride and hydrogen sulfide according to the literature. The acetoacetamide hydrochloride was prepared following the method described in Organic Syntheses with small modifications. Thus after the calculated amount of HCl-gas had been added to the solution the resulting oily mass was evaporated to dryness on a rotavapor and further dried in vacuo for 1 h. The resulting crystalline mass was used without further purification.

2-Chlorobenzophenone hydrasone was prepared from 2-chlorobenzophenone (0.03 mol 8.65 g) and excess hydrazine (8.7 g 95 %) in 25 ml abs. ethanol. The mixture was refluxed for 8 h, stirred overnight at room temperature, cooled and filtered. The precipitate was recrystallized from ethanol. Yield 74 %, m.p. 126 °C. (Found: 67.60; H 4.49; N 12.18. Calc. for C₁₁H₈N₂Cl: C 67.68; H 4.81; N 12.14).

The other hydrasones were prepared in a similar way, their physical constants were found in accordance with literature values.

N₂,N₄-Diis(diphenylmethylen)-formohydraside hydrasone. (Ia). Benzophenone hydrasone (19.6 g, 0.1 mol) was dissolved in 70 ml ethanol (abs.). O-Ethyl thioformate (9.0 g, 0.1 mol) was added dropwise over a period of 10 min at room temperature. The mixture was stirred until the evolution of hydrogen sulfide ceased. The precipitate was filtered off and the mother-liquor concentrated to give additional crystals. The compound was recrystallized from abs. ethanol.

(Ia) is insoluble in water, pentane, ether and soluble in benzene and chloroform.

IR (KBr, in cm⁻¹): 3310m, 1610s, 1583s, 1554m, 1491m, 1488m, 1443s, 1392m, 1118m.

¹H NMR (CDCl₃): δ 7.25 – 7.67 (20 H, m); 7.80 (1 H, d); 9.40 (1 H, d); JCH-NH = 9.5 Hz.

¹³C NMR: δ 126.3, 150.0, 138.1, 137.1, 155.6, 132.5, 129.8, 129.7, 129.4, 129.1, 128.7, 128.3, 127.9, 127.1.

MS m/e, (% of base peak): 402(38)M⁺, 401(29), 325(15), 22(3) 207(5), 195(35), 180(100), 165(31), 104(17), and 77(67).

N₂,N₄-Diis(4,4'-dimethylidiphenylmethylen)-formohydraside hydrasone (Ib) was prepared from equimolar amounts (0.1 mol) of 4,4'-dimethylbenzophenone hydrasone and O-ethyl thioformate in 70 ml ethanol as described for Ia. The mixture was stirred overnight and subsequently evaporated to dryness. The residual crystals were recrystallized from abs. ethanol.

IR (KBr, in cm⁻¹): 3300w, 1610sh, 1599s, 1582s, 1508m, 1240m, 1122w, 1110w.

¹H NMR(CDCl₃): δ 6.9 – 7.6 (16 H, m); 2.36 (s) 2.50 (s) 3 H, intensity 3/1; 7.76 (1 H, d); 9.40 (1 H, d); JCH-NH = 9.5 Hz.

¹³C NMR: δ 149.6, 139.5, 139.0, 138.8, 138.1, 135.7, 132.8, 130.3, 129.6, 128.9, 128.6, 127.1, 21.3.

MS m/e (% of base peak): 458(20)M⁺, 457(21), 367(4), 223(30), 208(77), 194(20), 179(32), 178(29), 165(13), 118(26), 91(100).

N₂,N₄-Diis(2-chlorophenylidiphenylmethylen)-formohydraside hydrasone (Ic). Prepared from 2-chlorobenzophenone hydrasone and O-ethyl thioformate as described for Ib.

IR (KBr, in cm⁻¹): 3320w, 1610s, 1585s, 1565m, 1442m, 1392m, 124n, 1060w.

¹H NMR(CDCl₃): δ 7.6 – 7.67(18 H, m); 7.80 (1 H, d); 9.21 (1 H, d) JCH-NH = 9.5 Hz.

MS m/e (% of base peak): 472(0.2), 471(0.2), 470(0.2), 435(2.5), 229(5), 214(18), 195(52), 180(4), 165(38), 138(7), 111(16), 104(13), 77(100).

N₂,N₄-Diis(4-chlorophenylidiphenylmethylen)-formohydraside hydrasone (Id). Prepared from 4-chlorobenzophenone hydrasone and O-ethyl thioformate as described for Ib.

IR (KBr, in cm⁻¹): 3305m, 1600s, 1580s, 1552m, 1484s, 1445m, 1395m, 1185m, 1085m, 998m.

¹H NMR(CDCl₃): δ 7.17 – 7.67 (18 H, m); 7.78 (1 H, d); 9.47 (1 H, d).

MS m/e (% of base peak): 472(10), 471(26), 470(26), 468(40), 408(17), 393(10), 398(10), 355(10), 231(21), 230(23), 229(54), 216(44), 216(19), 214(100), 199(10), 195(7), 180(25), 165(39), 119(21), 111(23), 105(17), 104(19), 91(21), 77(86).

N\textsuperscript{2},N\textsuperscript{4}-Bis(dibenzylmethylene)-formohydrazide hydrazone (1e). The procedure described for 1b yielded a crystalline mass which was a mixture of (1e) and dibenzylketone azine. The two compounds were separated on silica gel plates using CHCl\textsubscript{3} as eluent. The azine was identified by m.p. and IR, superimposable with IR of an authentic sample.

\[ \text{IR(KBr, in cm}^{-1}) : 3382m, 1638s, 1620s, 1599m, 1491s, 1461s, 1425m, 1340m, 1218m, 1091m, 1072m. \]

\[ \text{\textit{H} NMR (CDCl\textsubscript{3}) :} \delta \text{ the CH \textsubscript{4} protons occurred as 4 singlets of equal intensity at 3.35, 3.41, 3.59 and 3.83; 0.9 - 7.4 (20H, m); 7.62 (1H,d); 9.05 (1H,d); J\textsubscript{CH-\textsubscript{NH}} = 9.0 Hz.} \]

\[ \text{MSS}m/e \text{ (% of base peak): 458(0.7)M}^+ 416(6), 326(3), 325(8), 235(2), 206(6), 130(10), 117(11), 116(10), 115(7), 103(5), 92(31), 91(100), 77(8).} \]

\[ N\textsuperscript{2},N\textsuperscript{4}-Bis(diphenylmethylene)-acetohydrazide hydrazone (If). Benzophenone hydrazone (7.45 g, 0.038 mol) was dispersed in 30 ml of abs. ethanol. O-Ethyl thioacetate (2 g, 0.019 mol) in 1 ml abs. ethanol was added dropwise at room temperature. The mixture was refluxed for 6 h. Standing for three days at room temperature and an additional few hours in the freezer caused precipitation of If, which was recrystallized from ethanol. The residue which could be isolated from the mother liquor was a mixture of unreacted hydrazones and If according to the NMR spectrum.

\[ \text{IR(KBr, in cm}^{-1}) : 3295w, 1599s, 1591s, 1572s, 1548s, 1440m, 1410m, 1125m, 1038m, 1028m, 922m. \]
