It is well known that many compounds possessing a carboxamide moiety show a variety of pharmacological effects.1 The 2-aminocycloalkanecarboxamides exert a pronounced tranquilizing effect on the central nervous system.2-4

Very recently, a simple and rapid method has been developed for the reductive alkylation of 2- and 3-alkanolamines (3) using carbonyl compounds and sodium borohydride.3,4 The method was readily applicable to the synthesis of stereo-isomeric alicyclic 1,3-aminoalcohols.5 It combines the formation of oxazolidines or oxazines (2) from aminoalcohols (1) and oxo compounds with facile sodium borohydride reduction of the labile tautomer mixture thus obtained.6,7

The above method has now been used to synthesize the title compounds. The latter are not only of pharmacological potential but are also suitable ligands for the synthesis of platinum complexes possessing anticancer activity,8-10 they are also starting materials for the synthesis of saturated analogues of quinazolinone alkaloids.11-14

Results and discussion

Armarego15,16 reported that cis- and trans-2-aminocyclohexanecarboxamides (5a,b) and trans-2-aminocyclohexane-N-methylcarboxamide (6b) were formed by the reaction between aminoesters (4a,b) and methanolic ammonia or methylamine in a sealed tube at 110–120°C for 20 h. The crude cis amide (6a) has been prepared from the tosyl derivative of 6a but no melting

point was reported.\textsuperscript{17} We found that the amidation of esters 4a,b takes place even under very mild conditions, forming products 5a,b and 6a,b in good yields. These amides reacted readily with ketones (acetone, cyclohexanone and 2-butane were used) in ethanol solution. Without isolation of the products, the mixture was treated with sodium borohydride in boiling ethanol and derivatives 7a,b–9a,b were obtained in good yields. Starting from 5b and 2-butane, a mixture of the \textit{threo} and \textit{erythro} isomers of 10b was formed. The method is also applicable to aldehydes: starting from \textit{p}-chlorobenzaldehyde, compounds 11a,b were prepared (Scheme 1).

The above, mild amidation procedure was also applied to the preparation of ethyl \textit{cis}-2-aminoo-4-cyclohexenecarboxylate (12)\textsuperscript{18} which then gave 13 (Scheme 2).

  \node (d) at (1,-1) {CONH$_2$};
  \draw (c) -- (d);
\end{tikzpicture}
\end{center}

\textit{Scheme 2.}

It was found also that the reaction of cyclohexanone with 5a,b is very fast even at room temperature, and a catalytic reductive alkylation method was thus applied to synthesise compounds 9a,b. In the presence of a platinum catalyst under hydrogen atmosphere and under normal conditions, the \textit{N}-cyclohexyl derivatives 9a,b were formed in nearly quantitative yields.

In some cases the intermediate products were also isolated (14a,b and 15a,b).

\end{align*}

These compounds have stable perhydroquinazolinone structures, and no ring-chain tautomerism as in 1,3-oxazolidines or 1,3-oxazines could be observed. The slightly more vigorous reduction conditions required here than in the reduction of 2 to 3 can be explained by the stability of the perhydroquinazolinone structure. The aromatic analogues were also reductible with sodium borohydride in boiling ethanol.\textsuperscript{20}

\section*{Experimental}

Melting points were determined on a Büchi 510 capillary melting point apparatus and are uncorrected. \textsuperscript{1}H and \textsuperscript{13}C NMR spectra (data in Tables 1 and 2) were recorded at ambient temperature on a JEOL GX-400 FT NMR spectrometer in 5 mm tubes, using CDCl$_3$ as solvent and TMS as internal standard. The IR spectra were recorded on a PE 180 IR spectrometer by the KBr tablet method.

\textit{2-Aminocyclohexanecarboxamides (5a,b–6a,b).} Ethyl \textit{cis-} or \textit{trans-2-aminocyclohexanecarboxylate}\textsuperscript{16} (3.42 g, 20 mmol) was dissolved in 50 ml of methanolic ammonia (20 % NH$_3$) or methanolic methylamine (20 % CH$_3$NH$_2$). The solution was kept at room temp. for 3 weeks (NH$_3$) or 10 d (CH$_3$NH$_2$). The solvent was then evaporated and the residue crystallized from ethyl acetate. By repeating the amidation of the mother liquor, more product could be obtained. 5a: Yield 68 %, m.p. 125–127\degree C (from EtOAc; lit.\textsuperscript{15} yield 46 %, m.p. 124\degree C), IR/C=O 1665 cm\textsuperscript{-1}. 5b: Yield 64 %, m.p. 155–156\degree C (from EtOAc; lit.\textsuperscript{15} yield 69 %, m.p. 153–153.5\degree C), IR/C=O 1650 cm\textsuperscript{-1}. 6a: Yield 69 %, m.p. 80–83\degree C (from \textit{n}-hexane/acetone), IR/C=O 1645 cm\textsuperscript{-1}; anal. C$_8$H$_{18}$N$_2$O: C, H, N. 6b: Yield 66 %, m.p. 91–93\degree C (from \textit{n}-hexane/acetone; lit.\textsuperscript{17} yield 57 %, m.p. 90–91.5\degree C), IR/C=O 1645 cm\textsuperscript{-1}.

The cyclohexene derivative 13 was prepared in the same way starting from 12.\textsuperscript{19} Yield 66 %, m.p. 126–128\degree C (from EtOAc), IR/C=O 1660 cm\textsuperscript{-1}; anal. drochloride from ethanol/ether), IR/C=O 1655 cm⁻¹; anal C₁₄H₁₅ClN₂O: C, H, N. **11b:** Yield 77 %, m.p. 117–118 °C (from n-hexane), IR/C=O 1660 cm⁻¹; anal. C₁₄H₁₅ClN₂O: C, H, N.

2-Cyclohexylaminocyclohexancarboxamides (9a,b). Platinum oxide (30 mg) was pre-hydrogenated in 10 ml of ethanol, and carboxamide 5a or 5b (0.14 g, 1 mmol) and cyclohexanone (0.2 g, 2 mmol) were added. The mixture was stirred under hydrogen atmosphere and under normal conditions. On completion of the reduction (1.5 h, monitored by TLC) the catalyst was filtered off, and the solvent and the excess cyclohexancarboxamide were evaporated and the products were recrystallized from n-hexane and n-hexane/acetone, respectively. **9a:** Yield 86 %, m.p. 123–124 °C, IR/C=O 1655 cm⁻¹; anal. C₁₃H₂₁N₂O: C, H, N. **9b:** Yield 87 %, m.p. 81–83 °C, IR/C=O 1650 cm⁻¹; anal. C₁₃H₂₁N₂O: C, H, N.

**Quinazolinone intermediates (14a,b–15a,b).** Carboxamide 5a or 5b (0.14 g, 1 mmol) was heated under reflux in 10 ml of ethanol with acetic acid (3 mmol) or cyclohexanone (1.5 mmol) for 30 or 15 min, respectively. After evaporation of the solvent, 14a,b or 15a,b was obtained as a white crystalline solid. All four compounds were recrystallized from n-hexane. **14a:** Yield 89 %, m.p. 143–145 °C, IR/C=O 1665 cm⁻¹; anal. C₁₀H₁₄N₂O: C, H, N. **14b:** Yield 64 %, m.p. 164–165 °C, IR/C=O 1645 cm⁻¹; anal. C₁₀H₁₄N₂O: C, H, N. **15a:** Yield 69 %, m.p. 148–149 °C, IR/C=O 1660 cm⁻¹; anal. C₁₃H₂₁N₂O: C, H, N. **15b:** Yield 66 %, m.p. 190–191 °C, IR/C=O 1645 cm⁻¹; anal. C₁₃H₂₁N₂O: C, H, N.

The sodium borohydride reduction (as described above) of quinazolinones 14a,b and 15a,b resulted in compounds 8a,b and 9a,b.
