A simple and efficient synthesis of 2-(2,2,2-trifluoroethylidene)-1,3-dithianes is described. The title compounds are versatile intermediates for the preparation of trifluoromethyl derivatives.

A number of biologically active molecules contain a CF₃ group, and hence there has been much interest in the preparation of simple building blocks containing the trifluoromethyl group. Trifluoroacetic acid (TFA) and many derivatives thereof are commercially available, relatively inexpensive, and therefore suitable starting materials. Higher homologues are less accessible although they are well known. We describe herein a method for the preparation of 2-(2,2,2-trifluoroethylidene)-1,3-dithianes which are useful intermediates for the synthesis of trifluoromethyl-containing molecules. TFA anhydride was first selected as a low-cost CF₃-containing starting material. From its reaction with two equivalents of 2-lithio-1,3-dithiane at −78 °C, however, a near 1:1 mixture of the ketone 1 and the tertiary alcohol 5 together with recovered 1,3-dithiane was obtained. Variation in temperature and amount of nucleophile did not significantly improve the relative yield of the ketone 1. When the electrophile was ethyl trifluoroacetate the yield of the ketone 1 was increased to 80%, when the reaction was run at −15 °C for 5 h. Under these conditions, the tertiary alcohol 5 amounted to only 2% (GLC) of the crude product. This finding indicates that the addition of 2-lithio-1,3-dithiane to the carbonyl group is kinetically favoured over the deprotonation of the ketone 1 by 2-lithio-1,3-dithiane acting as a base. The lithium ethanolate from the ketone formation, however, may be the base which protects the ketone 1 from further addition by converting it to the enolate.

In the reactions of the ketone 1 with organometallics, lithium dimethylcuprate was tried initially because of its relatively low basicity, since the H-2 proton in the dithiane ring of the ketone was expected to be highly acidic. Organocopper compounds, however, are known to react slowly with ketones. At best, dimethylcuprate gave a mixture of the starting material and the addition product 2b in the ratio 2:3. The use of 1.1 mole equivalents of methyl lithium, however, at −78 °C gave the tertiary alcohol 2b in 79% yield. BuLi reacted in the same manner (71% yield). In contrast sec-BuLi and PhMgBr gave the corresponding alcohols in low yields (<10%). With sec-BuLi the main product was due to the competitive β-hydrogen elimination and reduction to the alcohol 2a. Presumably the bulkiness of the dithiane ring hinders the approach to the carbonyl carbon and hence the reaction is sensitive to steric effects in the nucleophile. Steric interference is further demonstrated in mesylation reactions. The alcohols 2a and 2b (R = H, Me) are readily mesylated, whereas the butyl homologue 2c underwent very little mesylation and the very bulky alcohol 5 did not react at all. Methanesulphonate can be eliminated from 2a and 2b by potassium tert-butoxide in THF or by sodium trimethylsilanolate in dichloromethane, the products being the 2-(2,2,2-trifluoroethylidene)-1,3-dithianes 4.

Cleavage of the ketene dithioacetals 4a and 4b with HgO–H₂SO₄ gives the corresponding acids 6, and we therefore have a convenient and efficient synthesis of these important acids. The double bond in the ketene dithioacetals 4 can be reduced by addition of sodium borohydride pellets to a solution in trifluoroacetic acid, or with triethylsilane in trifluoroacetic acid. The cleavage of the dithioacetal 7 with Hg(II) was run in ethanol whereby the acetals 8 were formed.

Acylation of the 2-(2,2,2-trifluoroethylidene)-1,3-dithiane 4a under Friedel–Crafts conditions (acyl chloride under the influence of zinc chloride catalysis) gives the α-oxoketene dithioacetal 9; α-oxoketene dithioacetals are versatile intermediates in organic synthesis. Experimental

The 1H NMR spectra were recorded at 60 MHz or at 300 MHz (specified). The mass spectra under electron-impact conditions were recorded at 70 eV ionizing voltage. Isobutane or ammonia was used for chemical ionization (CI).
2-(Trifluoroacetyl)-1,3-dithiane (1). A solution of butyl lithium in hexane (1.5 M, 91.49 mmol) was added dropwise with stirring, under nitrogen, to a solution of 1,3-dithiane (10.00 g, 83.17 mmol) in dry THF (300 ml) at −78 °C. The mixture was stirred at −78 °C for 3 h, allowed to warm to 0 °C over 30 min, and cooled to −20 °C before ethyl trifluoroacetate (10.63 g, 74.85 mmol) was added. The temperature was kept between −15 and −10 °C for 5 h before water (150 ml) was added and the mixture neutralized with 3 M HCl. Most of the THF was removed on a rotary evaporator and the remaining mixture was extracted with diethyl ether and drying (MgSO₄). Concentration and distillation of the extract gave 12.99 g (80%) of the title product, b.p. 54 °C/1.0 mmHg. Anal. C₃₅H₁₇O₂₇: C, H. 1H NMR (CDCl₃): δ 1.7–3.9 (6 H, m), 4.52 (1 H, s). MS: 216 (6, M), 121 (10), 120 (9), 119 (100), 106 (2), 105 (2), 104 (2), 91 (7). IR (cm⁻¹, film): 1670 (C=O).

2-(2,2,2-Trifluoro-1-hydroxyethyl)-1,3-dithiane (2a). 2-(Trifluoroacetyl)-1,3-dithiane (30.00 g, 0.139 mol) in diethyl ether (50 ml) was added to a suspension of lithium aluminum hydride (5.80 g, 0.153 mol) in diethyl ether (200 ml) at
0°C. After 15 min at ambient temperature the reaction mixture was refluxed for 90 min. The cooled mixture was poured into ice-water (150 ml), neutralized with 3 M hydrochloric acid and extracted with diethyl ether (3 × 100 ml). The dried (MgSO₄) solution was concentrated and distilled to give 26.34 g (87%) of the product 2a, b.p. 75°C/0.2 mmHg. Anal. C₇H₇F₂O₅S₄: C, H. ¹H NMR (CDCl₃): δ 1.8–2.3 (2H, m), 2.7–3.1 (4H, m), 3.43 (1H, d, J 6 Hz), 4.1–4.5 (1H m), 4.25 (1H, s). MS: 218 (12, M), 153 (1), 149 (3), 121 (1), 120 (5), 119 (100).

2-(2,2,2-Trifluoro-1-hydroxy-1-methyllyl)-1,3-dithiane (2b). A solution of methylthiolium in diethyl ether (2.0 M, 30.52 mmol) was added dropwise with stirring, under nitrogen, to a solution of 2-(trifluorooacetyl)-1,3-dithiane (6.00 g, 27.75 mmol) in dry diethyl ether (100 ml) at −78°C. The mixture was stirred at −78°C for 3 h and allowed to warm to ambient temperature over 30 min. The reaction mixture was poured into ice-cold hydrochloric acid (0.5 M, 100 ml) and the layers separated. The aqueous layer was extracted with diethyl ether (3 × 50 ml) and the combined ether extracts were dried (MgSO₄). Concentration and distillation of the extracts gave 5.12 g (79%) of 2b b.p. 62–64°C/0.1 mmHg. Anal. C₃H₃F₃S₂: C, H. ¹H NMR (300 MHz, CDCl₃): δ 1.56 (3 H, q, J 1.1 Hz), 1.8–2.0 (1H, m), 2.1–2.2 (1H, m), 2.85–3.0 (5H, m), 4.41 (1H, s). MS: 232 (2, M), 163 (1), 121 (1), 120 (6), 119 (100), 113 (2), 91 (6), 85 (6), 75 (12).

2-(1-Butyl-2,2,2-trifluoro-1-hydroxyethyl)-1,3-dithiane (2c). A solution of butyllithium in hexane (1.4 M, 40.69 mmol) was added dropwise with stirring, under nitrogen, to a solution of 2-(trifluorooacetyl)-1,3-dithiane (8.00 g, 36.99 mmol) in dry diethyl ether (150 ml) at −78°C. After 13 h at −78°C, the reaction mixture was allowed to warm to 27°C and kept at this temperature for 2 h. The reaction mixture was worked up as for 2b to give 7.05 g (71%) of the product 2c, b.p. 90–92°C/0.01 mmHg. Anal. C₇H₁₂F₂O₅S₄: C, H. ¹H NMR (300 MHz, CDCl₃): δ 0.94 (3H, t, J 7.2 Hz), 1.3–1.5 (4H, m), 1.85–2.0 (3H, m) 2.1–2.2 (1H, m), 2.85–3.0 (4H, m), 3.09 (1H, s, br), 4.39 (1H, s). MS: (Cl-isobutane): 275 (100, M+1), 274 (3), 275 (18), 119 (39).

2,2,2-Trifluoro-1-(1,3-dithian-2-yl)ethyl methanesulfonate (3a). Methanesulfonyl chloride (7.86 ml, 0.101 mol) was added to a solution of 2-(2,2,2-trifluoro-1-hydroxyethyl)-1,3-dithiane 2a (20.00 g, 91.63 mmol) and triethylamine (19.12 ml, 0.138 mol) in dichloromethane (400 ml) at 0°C. The reaction mixture was stirred at 0°C for 30 min before the solution was washed consecutively with ice-water, 1 M hydrochloric acid, saturated aqueous sodium hydrogen carbonate and saturated aqueous sodium chloride. Drying (MgSO₄) and evaporation gave 26.61 g (98%) of an analytically pure product 3a, m.p. 53°C. Anal. C₇H₇F₂O₅S₄: C, H. ¹H NMR (CDCl₃): δ 1.9–2.2 (2H, m), 2.7–3.1 (4H, m), 3.24 (3H, s), 4.17 (1H, d, J 6 Hz), 5.22 [1H, quint. (deg. dq), J 6 Hz]. MS: 296 (5, M), 202 (3), 201 (4), 200 (36), 121 (9), 120 (6), 119 (100).

2,2,2-Trifluoro-1-methyl-1-(1,3-dithian-2-yl)ethyl methanesulfonate (3b). Methanesulfonyl chloride (0.50 ml, 6.46 mmol) was added to a solution of 2-(2,2,2-trifluoro-1-hydroxy-1-methyllyl)-1,3-dithiane 2b (1.00 g, 4.30 mmol) and triethylamine (1.19 ml, 8.60 mmol) in dichloromethane (20 ml) at 0°C. The mixture was stirred at 0°C for 30 min before it was worked up as for 3a above to give 1.28 g (96%) of a crystalline product, pure enough for further use, m.p. 79°C (hexane). Anal. C₇H₁₃F₂O₅S₄: C, H. ¹H NMR (CDCl₃): δ 1.7–2.3 (2H, m), 2.02 (3H, s), 2.8–3.1 (4H, m), 3.18 (3H, s), 4.79 (1H, s). MS: 310 (3, M), 217 (1), 216 (5), 215 (8), 214 (23), 121 (11), 120 (7), 119 (100).

2,2,2-Trifluoroethyldenediyl-1,3-dithiane (4a): Method A. Potassium tert-butoxide (8.03 g, 71.56 mmol) was added to a solution of the methanesulfonate 3a (17.30 g, 58.38 mmol) in THF (200 ml) at 0°C. The reaction mixture was stirred at 0°C for 15 min and at 20°C for 45 min before it was poured into ice-water (200 ml). Most of the THF was removed on a rotary evaporator and the remaining mixture was extracted with diethyl ether (3 × 100 ml) and dried (MgSO₄). Concentration and distillation of the extract gave 9.50 g (81%) product, b.p. 44–46°C/0.1 mmHg. Anal. C₇H₁₃F₂O₅S₄: C, H. ¹H NMR (300 MHz, CDCl₃): δ 2.17 [2H, quint. (deg. t), J 6.8 Hz], 2.95–3.0 (4H, m), 5.82 (1H, q, J 8.2 Hz). MS: 200 (25, M), 181 (6), 167 (4), 149 (4), 147 (8), 138 (6), 126 (25), 45 (100).

Method B. Sodium trimethylsilanolate (0.448 g, 4.31 mmol) was added to a solution of the methanesulfonate 3a (1.16 g, 3.91 mmol) in dichloromethane (20 ml) at 0°C. The mixture was stirred at 0°C for 15 min and at 20°C for 45 min, before the mixture was washed with saturated aqueous sodium hydrogen carbonate (10 ml) and saturated aqueous sodium chloride (3 × 10 ml). After being dried (MgSO₄) and concentrated, the product was purified by Kugelrohr distillation (85°C, 1.2 mmHg). Yield, 0.60 g (77%).

2-(2,2,2-Trifluoro-1-methyllylthidene)-1,3-dithiane (4b): Method A. Compound 4b was obtained from the methanesulfonate 3b using method A above. The crude product was purified by Kugelrohr distillation (70°C/1.1 mmHg). Yield 75%. Anal. C₇H₁₃F₂O₅S₄: C, H. ¹H NMR (CDCl₃): δ 1.94 (3H, s), 1.9–2.3 (2H, m), 2.8–3.2 (4H, m). MS: 214 (100, M), 213 (14), 195 (7), 181 (4), 172 (10), 145 (20), 140 (30), 139 (49).

Method B. Sodium trimethylsilanolate (2.49 g, 22.20 mmol) was added to a solution of the methanesulfonate 3b (4.59 g, 14.79 mmol) in dry dichloromethane (75 ml) at 0°C. The reaction mixture was stirred for 15 min at 0°C and 4 h at 20°C before the mixture was worked up as in method B above. Distillation gave 1.73 g (55%) of the product 4b, b.p. 68°C/1.1 mmHg.
2,2,2-Trifluoro-1,1-bis-(1,3-dithian-2-yl)ethanol (5). 1,3-Dithiane (3.00 g, 24.95 mmol) in dry THF (90 ml) was lithiated with butyllithium following the procedure given for 1 above. Trifluoroacetic acid anhydride (1.65 ml, 11.88 mmol) in dry THF (10 ml) was added slowly to the reaction mixture at −78°C. After 15 h at −78°C and 1 h at 0°C, the reaction mixture was poured into ice-water (100 ml), neutralized with 3 M hydrochloric acid and extracted with dichloromethane (3 x 100 ml). The dried (MgSO₄) solution was concentrated and the crude product was purified by column chromatography (SiO₂; dichloromethane-hexane 3:2). Yield 1.28 g (32%), m.p. 104°C. ¹H NMR (CDCl₃): δ 1.8-2.2 (4 H, m), 1.27-3.1 (9 H, m), 4.66 (2 H, s). MS: 336 (1, M), 229 (22), 121 (8), 120 (5), 119 (100), 106 (1), 91 (3).

3,3,3-Trifluoropropanoic acid (6a). Sulfuric acid (2 M, 10 ml) and mercury(II) oxide (4.54 g, 20.97 mmol) were added to a solution of 2-(2,2,2-trifluoroethylidenyl)-1,3-dithiane (2.00 g, 9.99 mmol) in THF (40 ml). The reaction mixture was refluxed for 26 h with good stirring, cooled, and filtered, and the precipitate washed with THF (10 ml) and diethyl ether (3 x 10 ml). The combined organic layers were washed with saturated aqueous sodium chloride (50 ml), the layers separated, and the aqueous layer extracted with diethyl ether (3 x 10 ml). After the combined etheral extracts had been dried (MgSO₄) the solvent was removed by distillation (1 atm). The crude product was dissolved in sodium hydroxide (1 M, 10 ml) and the solution was washed with diethyl ether (3 x 5 ml), acidified with hydrochloric acid (1 M, 10 ml) and extracted with diethyl ether (4 x 10 ml). After the etheral extracts had been dried (MgSO₄), the solvent was removed by distillation (1 atm) and the product distilled under reduced pressure to give 0.77 g (60%) of 6a, m.p. 80°C/55 mmHg. Anal. C₆H₅F₃O₂: C, H. ¹H NMR (CDCl₃): δ 3.25 (2 H, q, J 10 Hz), 9.25 (variable: 9.25-11.7, 1 H, s, br). MS: 128 (13, M), 111 (45), 91 (14), 89 (20), 83 (21), 69 (25), 64 (82), 45 (100).

3,3,3-Trifluoro-2-methylpropanoic acid (6b). Compound 6b was obtained from 2-(2,2,2-trifluoro-1-methylthiylidenyl)-1,3-dithiane using the procedure given above for 6a. The crude product was purified by Kugelrohr distillation (80°C/40 mmHg). Yield 40%. Mol. wt., obs. 142.0237. Calc. for C₆H₅F₃O₂: 142.0242. ¹H NMR (CDCl₃): δ 1.45 (3 H, d, J 7 Hz), 3.26 [1 H, septet (deg. q), J 7 Hz], 1.12 (1 H, s). MS: 142 (4, M), 125 (24), 122 (21), 103 (10), 102 (51), 97 (15), 79 (2), 78 (65), 77 (100).

2-(2,2,2-Trifluoroethyl)-1,3-dithiane (7a): Method A. Sodium borohydride pellets (2.97 g, 78.61 mmol) were cautiously added to trifluoroacetic acid (60 ml) under nitrogen at 0°C, before a solution of 2-(2,2,2-trifluoroethylidene)-1,3-dithiane (3.00 g, 14.98 mmol) in dry dichloromethane (40 ml) was added. After 15 min at 0°C, and 1 h at ambient temperature all the sodium borohydride had dissolved and the solvent was removed under reduced pressure. The residue was poured into ice-water, and stirred for 1 h. The mixture was neutralized with aqueous sodium hydroxide (5 M) and extracted with hexane (6 x 50 ml). The combined extracts were dried (MgSO₄) and concentrated and the residue was distilled to give 1.97 g (65%) of the product 7a, b.p. 83°C/8 mmHg. Anal. C₆H₅F₃S₂: C, H. ¹H NMR (CDCl₃): δ 1.7-3.1 (8 H, m), 4.28 (1 H, t, J 7.7 Hz). MS: 202 (100, M), 169 (3), 160 (2), 155 (13), 128 (14), 127 (15), 119 (77), 74 (79).

Method B. Triethylsilane (2.56 g, 22.00 mmol) was added to 2-(2,2,2-trifluoroethylidene)-1,3-dithiane (4.00 g, 20.00 mmol) in dry dichloromethane (40 ml), before trifluoroacetic acid (11.40 g, 100.00 mmol) was added at 0°C. After 15 min at 0°C and 15 h at ambient temperature the reaction mixture was poured into saturated aqueous sodium hydroxide (100 ml) and extracted with dichloromethane (3 x 50 ml). The dichloromethane solution was washed with saturated aqueous sodium hydrogen carbonate (50 ml) and dried (MgSO₄). Concentration and distillation of the residue gave 1.45 g (35%) of the product 7a.

2-(2,2,2-Trifluoro-1-methylthylidene)-1,3-dithiane (7b). Sodium borohydride pellets (1.59 g, 42.00 mmol) were cautiously added to trifluoroacetic acid (40 ml) under nitrogen at 0°C, before 2-(2,2,2-trifluoro-1-methylthiylidenyl)-1,3-dithiane (1.50 g, 7.00 mmol) in dry dichloromethane (20 ml) was added. After 15 min at 0°C and 3 h at ambient temperature more sodium borohydride pellets (1.59 g, 42.00 mmol) were added. After a further 20 h at ambient temperature, the reaction mixture was worked up as in method A above. After the organic extracts had been dried (MgSO₄) and concentrated the crude product was purified by Kugelrohr distillation (100°C/8 mmHg) to give 1.28 g (85%) of the product 7b, calc. for C₆H₅F₃S₂: 216.0254. ¹H NMR (300 MHz, CDCl₃): δ 1.34 (3 H, d, J 7.1 Hz), 1.8-1.9 (1 H, m), 2.1-2.5 (2 H, m), 2.8-3.1 (4 H, m), 4.48 (1 H, d, J 7.9 Hz). MS: 216 (37, M), 169 (2), 142 (3), 141 (5), 122 (3), 121 (11), 120 (6), 119 (100).

1,1-Diethoxy-3,3,3-trifluoropropane (8a). Mercury(II) chloride (4.03 g, 14.83 mmol) and red mercury(II) oxide (1.61 g, 7.42 mmol) were added, under nitrogen, to a solution of 2-(2,2,2-trifluoroethyl)-1,3-dithiane (1.00 g, 4.94 mmol) in absolute ethanol (50 ml). The reaction mixture was heated under reflux for 3 days with good stirring, cooled to 0°C and filtered. The filtrate was poured into saturated aqueous sodium hydrogen carbonate (100 ml) and stirred for 15 min. The mixture was then filtered and extracted with hexane (8 x 50 ml). After the combined organic extracts had been dried (K₂CO₃), the solvent was removed by distillation (1 atm). The crude product was purified by Kugelrohr distillation (130°C/1 atm) with solid CO₂ cooling to give 0.25 g (27%) of the product 8a, calc. for C₆H₅F₃O₂: 185.0796. ¹H NMR (300 MHz, CDCl₃): δ 1.22 (6 H, t, J 7.0 Hz), 2.46 (2 H, qd, J 10.7, 5.5 Hz), 3.5-3.7 (4 H, m), 4.82 (1 H, t, J 5.5 Hz). ¹³C NMR (75 MHz, CDCl₃): δ 15.0 (CH₃), 38.6
(CH₂, q, J 27 Hz), 61.8 (CH₃O), 97.2 (CH₃, q, J 4 Hz), 125.2 (CF₃, q, J 276 Hz). MS: 185 (0.1, M⁻¹), 157 (0.3), 143 (0.2), 142 (3), 141 (51), 129 (2), 114 (3), 113 (100), 103 (29), 93 (39). MS (CI-NH₃): 204 (18, M + NH₃), 158 (17), 141 (12), 129 (14), 121 (6), 109 (25), 103 (100).

1,1-Diethoxy-3,3,3-trifluoro-2-methylpropene₁₁ (8b). Compound 8b was prepared from 2-(2,2,2-trifluoro-1-methyl-ethyl)-1,3-dithiane 7b using the procedure given above for 8a, except that the heating was limited to 2 days. The crude product was purified by Kugelrohr distillation (85°C/70 mmHg) to give 0.31 g (33%). Mol. wt., obs. 199.0931. Calc. for C₇H₁₅F₃O₂ (M-H): 199.0946. ¹H NMR (300 MHz, CDCl₃): δ 1.17 (3 H, d, J 7.1 Hz), 1.21 (3 H, t, J 7.0 Hz), 1.22 (3 H, t, J 7.0 Hz), 2.4-2.6 (1 H, m), 3.5-3.6 (2 H, m), 3.65-3.8 (2 H, m), 4.58 (1 H, d, J 5.1 Hz). ¹³C NMR (75 MHz, CDCl₃): δ 7.8 (CH₃), 15.0 (CH₃), 42.3 (CF₃CH, q, J 25 Hz), 63.0 (CH₃), 63.5 (CH₃), 100.9 (CF3CHCH, q, J 3 Hz), 126.8 (CF₃, q, J 280 Hz). MS: 199 (0.2, M⁻¹), 171 (0.6), 156 (4), 155 (59), 128 (4), 127 (98), 107 (69), 103 (54), 79 (43), 75 (46), 47 (100), MS (CI-NH₃): 218 (22, M+NH₄⁺), 173 (3), 172 (34), 155 (24), 143 (69), 135 (43), 132 (14), 126 (44), 123 (34), 106 (10), 104 (8), 103 (100).

2-(2-Oxo-1-trifluoromethylpropyldiene)-1,3-dithiane (9). Zinc chloride (136 mg, 1.0 mmol) was added to a solution of 2-(2,2,2-trifluoroethyldene)-1,3-dithiane 4a (200 mg, 1.0 mmol) in acetyl chloride (3 ml). The mixture was heated at 65°C for 18 h before the acetyl chloride was evaporated off. The residue was dissolved in acetone, poured into saturated aqueous sodium hydrocarbonate and extracted with diethyl ether. The ether solution was washed consecutively with saturated aqueous sodium hydrocarbonate and saturated aqueous sodium chloride, then dried (MgSO₄) and evaporated. The crude product was purified by column chromatography (SiO₂; hexane–EtOAc 5:1). Yield 172 mg (71%), m.p. 37°C. Anal. C₇H₁₅F₃O₂: C, H. ¹H NMR (300 MHz, CDCl₃): δ 2.24 (2 H, tt, J 7.0, 7.0 Hz), 2.34 (3 H, q, J 2.0 Hz), 2.91 (2 H, t, J 7.0 Hz), 3.03 (2 H, t, J 7.0 Hz). ¹³C NMR (75 MHz, CDCl₃): δ 23.6, 29.2 and 29.5 (SCCH₂CH₂CH₂S), 29.7 (CH₃, q, J 4 Hz), 123.2 (CF₃, q, J 274 Hz), 124.3 (CF₃C- =, q, J 31 Hz), 168.1 (CF₃C=C), 192.4 (C=O). MS: 242 (49, M), 229 (7), 228 (7), 227 (76), 209 (8), 200 (6), 181 (4), 157 (4), 153 (34), 43 (100). IR (cm⁻¹, KBr): 1645, 1652 and 1690.
