3-Hydroxyisoxazole Bioisosteres of GABA. Synthesis of a Series of 4-Substituted Muscimol Analouges and Identification of a Bicyclic 2-Isoxazoline Rearrangement Product

Hans Hjeds*, Inge T. Christensen, Claus Cornett, Bente Frølund, Erik Falch, Jørgen B. Pedersen and Povl Krosggaard-Larsen

PharmaBiotec Research Center, Department of Organic Chemistry, The Royal Danish School of Pharmacy, DK-2100 Copenhagen, Denmark

3-Hydroxy-4-(2-hydroxyethyl)-5-methylisoxazole (1) was used as the starting material for the syntheses of the muscimol (5-aminomethyl-3-hydroxyisoxazole) analogues 9, 10 and 14, containing 2-acetoxyethyl, 2-hydroxyethyl, and 2-chloroethyl substituents, respectively, in the 4-position of the ring. These analogues were synthesized via bromination of the 5-methyl groups of the di-O-protected derivative of 1 (5) followed by a Gabriel phthalimide reaction. N'-Deprotection of 4-(2-chloroethyl)-3-methoxy-5-phthalimidomethylisoxazole (12), an intermediate for the preparation of 14, followed by cyclization and O-deprotection form the last steps of a new synthesis of the clinically active bicyclic muscimol analogue, (4,5,6,7-tetrahydroisoxazolo[5,4-c]pyridin-3-ol) (THIP) (16). Whereas treatment of 4-(2-hydroxyethyl)-3-methoxy-5-methylisoxazole (3a) with bromine or with NBS gave the bicyclic 2-isoxazoline 17a. A similar treatment of the 4-(3-hydroxypropyl) homologue (3b) of 3a did not provide the 6-membered ring analogue of 17a (17b). Whilst muscimol and THIP are very potent agonists at GABA_A receptors, none of the muscimol analogues 9, 10 or 14 showed significant affinity for GABA_A receptor sites in vitro.

Reduced activity of the central 4-aminobutanoic acid (GABA) neurotransmitter system, probably reflecting degeneration of GABA neurones, is associated with certain neurological disorders such as Huntington’s chorea,^1^ epilepsy,^2,3^ and tardive dyskenesia.^4,5^ Although the specific GABA_A agonists muscimol^6^ and 4,5,6,7-tetrahydroisoxazolo[5,4-c]pyridin-3-ol (THIP)^7^ (Fig. 1) show limited clinical effects in these diseases,^8-10^ GABA_A-receptor-stimulating drugs may have clinical interest. The lack of marked clinical effects of muscimol or THIP may reflect rapid desensitization of the target GABA_A receptors as a result of prolonged activation by these GABA_A agonists showing full or almost full, respectively, GABA_A agonist efficacy.12-15 If this is the case, low-efficacy GABA_A agonists

such as the non-fused THIP analogue 3-hydroxy-5-(4-piperidyl)isoxazole (4-PIOL)\textsuperscript{16-19} (Fig. 1) may have therapeutic interest.

Unfortunately, 4-PIOL, which does not cause significant receptor desensitization,\textsuperscript{19} is unable to cross the blood-brain barrier (BBB) making behavioural animal studies on this novel GABA\textsubscript{A} agonist very difficult.\textsuperscript{18,20} THIP and muscimol, on the other hand, are capable of penetrating the BBB,\textsuperscript{21,22} and since THIP shows reduced GABA\textsubscript{A} agonist efficacy as compared with muscimol in \textit{in vitro} test systems,\textsuperscript{14,15} we decided to synthesize the muscimol analogues 9, 10 and 14 containing alkyl groups in the 4-position of the ring, equivalent to the position of the ethylene ring residue of THIP. Although 4-hydroxymuscimol is only weak and 4-ethylmuscimol virtually inactive as GABA\textsubscript{A} agonists,\textsuperscript{23,24} we wished to investigate the influence of substituents of different size and polarity in the 4-alkyl groups (Fig. 1) on the GABA\textsubscript{A} receptor affinity of the compounds.

**Results and discussion**

3-Hydroxy-4-(2-hydroxyethyl)-5-methylisoxazole (1)\textsuperscript{25} was methylated using diazomethane, and the O-methylated product 3a, separated from the isomeric N-methylated compound 2, was acetylated to give 5 (Scheme 1). Regioselective bromination of 5 and treatment of the bromomethyl product 6 with potassium phthalimide gave 7, which was deprotected stepwise to give the desired muscimol analogues 9 and 10.

Compound 12, which was synthesized in two steps from 7, was converted into the desired compound 14 in two steps using acid deprotection reagents. Cleavage of the phthal-
imide group of 12 by treatment with hydrazine resulted in spontaneous cyclization to 3-methoxy-4,5,6,7-tetrahydroisoxazolo[5,4-c]pyridine (O-methyl-THIP, 15). O-Demethylation of 15 gave THIP hydrobromide (16). These reactions represent an alternative synthesis of the GABA<sub>A</sub> receptor agonist, THIP. The prospects of the new synthesis in terms of large scale preparation of THIP are under investigation.

In order to synthesize the key intermediate 7 in better yields, attempts to convert 3a into the corresponding 5-bromomethyl analogue by treatment with N-bromosuccinimide (NBS) or with bromine unexpectedly resulted in cyclization of 3a into 17a. The mechanism(s) underlying this cyclization reaction are unknown. In order to elucidate the scope of this cyclization reaction, the homologue 3b of 3a was treated with NBS or with bromine under similar conditions. These reactions did, however, lead to very complex reaction mixtures, in from which 17b could not be detected/isolated.

All new compounds gave correct analyses and consistent IR and <sup>1</sup>H NMR spectra. The structure assigned to 17a is supported by its IR spectrum in which OH stretching vibrations as well as the absorption bands at 1660 and 1530 cm<sup>-1</sup>, characteristic of 3-oxogynenyl 4,5-disubstituted isoxazoles, are absent. In the mass spectrum, peaks at m/z 235 and 237 are consistent with the formula C<sub>13</sub>H<sub>9</sub>BrNO<sub>3</sub> for 17a. The pattern of resonance signals in the 250 MHz <sup>1</sup>H NMR spectrum of 17a indicated that the ethylene chain is incorporated into a ring structure. The two quartets at δ 23 (C-6a-CH<sub>3</sub>) and at δ 58 (O-CH<sub>3</sub>) in the 62.9 MHz <sup>13</sup>C NMR spectrum support the proposed structure of 17a (Fig. 2).

![Fig. 2](image)

The new muscimol analogues 9, 10 and 14 were tested in vitro as potential inhibitors of <sup>3</sup>H-GABA binding. Whereas muscimol (IC<sub>50</sub> = 0.006 μM) and THIP (IC<sub>50</sub> = 0.1 μM) are potent inhibitors in this assay for GABA<sub>A</sub> receptor affinity, none of the compounds 9, 10 and 14 showed significant inhibitory effect when tested at concentrations of 100 μM. Steric effects of the C-4 substituents may impede binding of these muscimol analogues to GABA<sub>A</sub> receptor sites. Alternatively, or in addition, these substituents may prevent the aminomethyl groups of these compounds from adopting receptor-active conformations similar to that reflected by the conformationally restricted muscimol analogue THIP (Fig. 1).

**Experimental**

Routine analytical procedures have been described in a previous paper. The 250 MHz <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded on a Bruker AM-250 spectrometer. GC–MS analyses were carried out on a Finnigan 9611 gas chromatograph using a fused silica J&W DB-5 column (30x0.25 mm, film 0.25 μm). Coupled to a Finnigan MAT 4515B mass spectrometer in the EI mode. Thin layer and column chromatography (CC) were accomplished using silica gel GF<sub>254</sub> plates (Merck) and silica gel, 0.05–0.20 mm (Merck), respectively. Flash chromatography was performed on silica gel 60 H (Merck). HPLC analyses were carried out on a Shimadzu LC-6A Liquid Chromatograph system (Column: 15.0 cm×4.6 mm 1D Supelcosil LC-18-DB (5 μ); mobile phase: methanol–water (50:50); flow rate: 1.0 ml min<sup>-1</sup>; room temperature; pressure: 1150 psi; detection: UV (254 nm)) combined with a C-R6A Chromatopac data processor. All evaporation were performed at ca. 15 mmHg using a rotary evaporator.

4-[(2-Hydroxyethyl)-2,5-dimethylisoxazol-3(2H)-one (2) and 4-[(2-hydroxyethyl)-3-methoxy-5-methylisoxazole (3a). Dioxanemethane (ca. 2.4 g, ca. 58 mmol), prepared from N-methyl-N-nitroso-4-toluene sulfonamide (15.5 g, 67.5 mmol), was added with stirring at room temperature to a mixture of 12 (7.93 g, 55 mmol) and ether (150 ml). After an additional 2 h of stirring, the excess of diazomethane was destroyed by addition of a small excess of acetic acid. The reaction mixture was evaporated to dryness and the residue flash-chromatographed [eluents: ethyl acetate containing methanol (5-25%)]. Yields: 2, 4.01 g (46%) and 3a, 3.63 g (42%) as colourless oils.

An analytical sample of crude 2 was distilled in a Kugelrohr apparatus at 190°C/2 mmHg to give analytically pure 2. Anal. C<sub>11</sub>H<sub>9</sub>BrNO<sub>3</sub>; C, H, N. IR (film): 3600–3100 (several bands, s), 1640 (s), 1425 (m) cm<sup>-1</sup>. <sup>1</sup>H NMR (60 MHz, CDCl<sub>3</sub>): δ 3.9 (3 H, s), 3.7 (2 H, t, J 6 Hz), 2.7 (1 H, s), 2.5 (2 H, t, J 6 Hz), 2.3 (3 H, s).

A sample of crude 3a was distilled in a Kugelrohr apparatus at 150°C/1 mmHg to give analytically pure 3a. Anal. C<sub>11</sub>H<sub>9</sub>NO<sub>3</sub>; C, H, N. Found. C 52.29. Calc., C 53.49. IR (film): 3600–3100 (several bands, s), 3000–2750 (several bands, m), 1650 (m), 1520 (s), 1470 (s), 1410 (s) cm<sup>-1</sup>. <sup>1</sup>H NMR (60 MHz, DMSO-d<sub>6</sub>): δ 3.84 (1 H, s), 3.53 (2 H, t, J 7 Hz), 3.40 (3 H, s), 2.35 (2 H, t, J 7 Hz), 2.23 (3 H, s).

4-[(3-Hydroxypropyl)-3-methoxy-5-methylisoxazole (3b). NaBH<sub>4</sub> (624 mg, 16.5 mmol) was added to a solution of 4<sup>1</sup> (1.07 g, 5 mmol) in THF (15 ml), and the mixture was heated to 50°C. Over a period of 30 min, MeOH (3.5 ml) was added with stirring, and heating and stirring were continued for a further 2 h. NaBH<sub>4</sub> (150 mg, 4 mmol) was added, and heating and stirring were continued for 1 h. Water (25 ml) was added to the cooled (room temperature) mixture which was then concentrated to ca. 15 ml. The mixture was extracted with ethyl acetate (3×30 ml).
pooled extracts were dried (MgSO₄), filtered and evaporated to dryness to give pure 2b. Yield 790 mg (92 %) as a colourless oil. Anal. C₉H₅NO₂; C, H, N. IR (film): 3700–3100 (s), 3000–2800 (several bands, s), 1650 (s), 1525 (s), 1470 (s), 1410 (s) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 3.92 (3 H, s), 3.50 (2 H, t, J 7 Hz), 2.56 (1 H, s), 2.30 (2 H, t, J 7 Hz), 2.23 (3 H, s), 1.9–1.3 (2 H, m).

4-(2-Acetoxyethyl)-3-methoxy-5-methylisoxazole (5). Phosphoric acid (85 %, 5 drops) was added to a mixture of 3a (3.14 g, 20 mmol) in acetic anhydride (6.0 ml). The solution was kept at 80°C for 15 min then cooled to room temperature. Water (1 ml) was added with stirring, and the ice-cooled solution was extracted with dichloromethane (3×10 ml). The pooled extracts were dried (MgSO₄), filtered and evaporated to dryness. The crude product was distilled in a Kugelrohr apparatus at 140°C/10⁻³ mmHg to give 3.20 g (80 %) of 5 as a colourless oil. Anal. C₉H₅NO₂; C, H, N. IR (film): 3100–2800 (several bands, m), 1740 (s), 1655 (m), 1520 (s), 1470 (s), 1410 (s), 1380 (w), 1360 (m) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 4.06 (2 H, t, J 7 Hz), 3.92 (3 H, s), 2.51 (3 H, t, J 10.0 Hz), 2.26 (3 H, s), 1.96 (3 H, s).

4-(2-Acetoxyethyl)-3-bromomethyl-3-methoxyisoxazole (6). A mixture of 5 (1.20 g, 6 mmol) and bromine (2.0 ml, 36 mmol) was stirred at room temperature for 8 days. The bromine was evaporated off and the residue was dissolved in dichloromethane (10 ml). After addition of water (10 ml) and Na₂S₂O₃ to decolorise the mixture, the organic layer was isolated, dried (K₂CO₃) and filtered. After evaporation to dryness the residue was submitted to CC [silica gel 50 g; eluent: toluene–ethyl acetate (9:1)]. The fractions containing pure 6 were pooled and evaporated to give 0.85 g (51 %) of 6 as a colourless oil. Anal. C₁₁H₇BrNO₄; C, H, Br, N. IR (film): 3100–2800 (several bands, m), 1740 (s), 1650 (m), 1520 (s), 1460 (m), 1410 (s), 1380 (w), 1360 (m) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 4.33 (2 H, s), 4.20 (2 H, t, J 7 Hz), 4.00 (3 H, s), 2.66 (2 H, t, J 7 Hz), 2.05 (3 H, s).

4-(2-Acetoxyethyl)-3-methoxy-5-phthalimidomethylisoxazole (7). A mixture of 6 (278 mg, 1 mmol), potassium phthalimide (204 mg, 1.1 mmol) and N,N-dimethylacetamide (10 ml) was kept at 120°C for 90 min. The mixture was cooled to room temperature, water (20 ml) was added and the mixture was stirred for 15 min. The crystals were filtered off, washed with water and dried to give 220 mg (64 %) of 7 as colourless crystals. M.p. 99–100°C. Anal. C₁₇H₁₃NO₄; C, H, N. IR (KBr): 3650–3200 (w), 3100–2800 (several bands, w), 1760 (m), 1740 (s), 1720 (s), 1660 (w), 1610 (w), 1525 (s), 1460 (m), 1410 (s), 1390 (s), 1350 (m) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 8.0–7.6 (4 H, m), 4.86 (2 H, s), 4.22 (2 H, t, J 7 Hz), 3.96 (3 H, s), 2.80 (2 H, t, J 7 Hz), 2.03 (3 H, s).

4-(2-Acetoxyethyl)-3-hydroxy-5-phthalimidomethylisoxazole (8). A mixture of 7 (172 mg, 0.5 mmol) and AcOH containing 33 % HBr (5 ml) was kept at 50°C with stirring for 90 min. The mixture was cooled to room temperature and evaporated to dryness at 50°C. The crude product was crystallized from toluene–ethyl acetate to give 90 mg (55 %) of 8 as colourless crystals. M.p. 149–150°C. Anal. C₁₇H₁₃NO₄; C, H, N. IR (KBr): 3700–3300 (several bands, w), 3300–2300 (several bands, w), 1770 (w), 1710 (s), 1660 (w), 1525 (m), 1460 (w), 1410 (m), 1390 (s), 1340 (m) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 9.50 (1 H, s), 8.0–7.6 (4 H, m), 4.83 (2 H, s), 4.20 (2 H, t, J 7 Hz), 2.76 (2 H, t, J 7 Hz), 1.96 (3 H, s).

4-(2-Acetoxyethyl)-5-aminomethyl-3-hydroxyisoxazole hemihydrate (9) and 5-aminomethyl-4-(2-hydroxyethyl)-3-hydroxyisoxazole hydrochloride (10). Hydrazine monohydrate (250 µl, 5.0 mmol) was added to a solution of 8 (840 mg, 2.5 mmol) in MeOH (25 ml), and the mixture was refluxed for 1 h. The mixture was cooled to room temperature and the filtered solution was evaporated to ca. 10 ml and stored overnight at 5°C. The crystals were filtered off and dissolved in water (3 ml) and after filtration the solution was evaporated to dryness. The residue was recrystallized from MeOH–water to give colourless crystals of 9 as a hemihydrate. Yield: 119 mg (23 %). M.p. 146–147°C.

The pooled mother liquors were evaporated to dryness and after addition of MeOH containing 10 % HCl (5 ml), the solution was refluxed for 4 h. After being cooled to room temperature and filtered, the solution was evaporated to dryness. The residue was crystallized from MeOH–ether to give 10 as colourless crystals. Yield: 80 mg (17 %). M.p. 174–176°C (decomp.). Anal. C₁₇H₁₃ClNO₄; C, H, Cl, N. IR (KBr): 3700–3250 (s), 3250–2300 (several bands, s), 2000 (w), 1660 (m), 1610 (w), 1545 (s), 1480 (m), 1360 (m) cm⁻¹. ¹H NMR (60 MHz, DMSO-d₆): δ 8.70 (3 H, s), 5.15 (2 H, s), 4.08 (2 H, q, J 7 Hz), 3.52 (2 H, t, J 7 Hz), 2.51 (2 H, t, J 7 Hz).

4-(2-Hydroxyethyl)-3-methoxy-5-phthalimidomethylisoxazole (11). A solution of 7 (2.0 g, 5.8 mmol) in MeOH containing 5 % HCl (100 ml) was refluxed for 2 h. After evaporation to dryness the residue was crystallized from toluene–light petroleum to give 11 as colourless crystals. Yield: 1.21 g (40 %). M.p. 95.5–96.5°C. Anal. C₁₇H₁₃NO₄; C, H, N. IR (KBr): 3480 (s), 3000–2800 (several bands, w), 1770 (s), 1720 (s), 1710 (s), 1660 (m), 1610 (w), 1525 (s), 1410 (s), 1390 (s) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 8.0–7.7 (4 H, m), 4.86 (2 H, s), 3.93 (2 H, s), 3.76 (2 H, t, J 7 Hz), 2.67 (2 H, t, J 7 Hz).
4-(2-Chloroethyl)-3-methoxy-5-phenylimidomethylisoxazole (12). A mixture of 11 (1.0 g, 3.32 mmol), pyridine (265 mg, 3.32 mmol) and SOCl₂ (592 mg, 5.0 mmol) in toluene (20 ml) was heated with stirring at 60°C for 10 h. After filtration and evaporation to dryness the residue was crystallized from toluene-light petroleum to give 12 as colourless crystals. Yield: 770 mg (72%). M.p. 108–109°C. Anal. C₁₅H₁₃ClN₂O; C, H, Cl, N. IR (KBr): 3700–3200 (several bands, m), 3100–2800 (several bands, w), 1770 (m), 1720 (s), 1710 (s), 1650 (m), 1525 (s), 1460 (s), 1450 (w), 1415 (s), 1385 (s) cm⁻¹. ¹H NMR (60 MHz, CDCl₃): δ 8.0–7.7 (4 H, m), 4.86 (2 H, s), 3.93 (3 H, s), 3.68 (2 H, t, J 7 Hz), 2.94 (2 H, t, J Hz).

4-(2-Chloroethyl)-3-methoxy-5-phenylimidomethylisoxazole (13). A mixture of 12 (750 mg, 2.34 mmol) and AcOH containing 33% HBr (6 ml) was heated with stirring at 50°C for 2 h. After evaporation to dryness another portion of AcOH containing 33% HBr (6 ml) was added and heating and stirring were repeated at 50°C for 2 h. The last procedure was repeated a third time. The residue after final evaporation, was crystallized from ethyl acetate to give 13. Yield: 468 mg (65%). M.p. 189–190°C. Anal. C₁₅H₁₃ClN₂O; C, H, Cl, N. IR (KBr): 3700–3300 (m), 3200–2500 (several bands, m), 1770 (m), 1720 (s), 1710 (s), 1660 (m), 1540 (s), 1520 (m), 1470 (w), 1420 (m), 1400 (s), 1350 (m) cm⁻¹. ¹H NMR (60 MHz, DMSO-d₆): δ 11.60 (1 H, s), 7.89 (4 H, m), 4.81 (2 H, s), 3.73 (2 H, t, J 7 Hz), 3.32 (2 H, s), 2.84 (2 H, t, J 7 Hz).

5-Aminomethyl-4-(2-chloroethyl)-3-hydroxyisoxazole hydrochloride (14). A mixture of 13 (300 mg, 0.98 mmol) and 6 M HCl (12 ml) was refluxed for 3 h. After evaporation to dryness the residue was dissolved in water (10 ml) and extracted continuously for 2 h using ether–dichloromethane. The aqueous phase was evaporated to dryness and the residue was crystallized from MeOH–ether to give 14 as colourless crystals. Yield: 25 mg (11%). M.p. 153–155°C (decomp.). Anal. C₁₅H₁₃ClN₂O; C, H, Cl, N. IR (KBr): 3700–3300 (m), 3300–2500 (several bands, s), 1670 (m), 1595 (m), 1570 (w), 1520 (s), 1480 (s), 1340 (m), 1375 (w) cm⁻¹. ¹H NMR (60 MHz, DMSO-d₆): δ 11.71 (1 H, s), 8.61 (3 H, s), 4.13 (2 H, s), 3.73 (2 H, t, J 7 Hz), 2.82 (2 H, t, J 7 Hz).

3-Methoxy-4,5,6,7-tetrahydroisoxazolo[5,4-c]-pyridinium chloride (15). A solution of 12 (200 mg, 0.62 mmol), MeOH (6 ml) and hydrazine hydrate (36 mg, 0.68 mmol) was refluxed with stirring for 12 h. The mixture was evaporated and the residue was acidified to pH ca. 2 with 4 M HCl. After extraction with four 10-ml portions of dichloromethane, to the aqueous phase was added 10% aqueous NaHCO₃, to pH ca. 11. Continuous extraction of the alkaline solution with ether–dichloromethane (5:1) for 2 h gave a crude extract which was dried (MgSO₄), filtered and evaporated to dryness. The crude product was dissolved in 4 M HCl (1 ml) and evaporated to dryness. Crystallization from MeOH–ether gave 15 as colourless crystals. Yield: 70 mg (59%). M.p., IR and ¹H NMR spectra were identical with those of an authentic sample.

3-Hydroxy-4,5,6,7-tetrahydroisoxazolo[5,4-c]pyridinium bromide (THIP hydrobromide) (16). A mixture of 15 (70 mg; 0.37 mmol) and AcOH containing 33% HBr (3 ml) was kept at 50°C for 90 min. The solution was dissolved in water (5 ml) and charcoal (200 mg) was added. The mixture was boiled for 2 min, filtered and evaporated to dryness. The residue was crystallized from ethanol–ether to give 16 as colourless crystals. Yield: 27 mg (33%). M.p., IR and ¹H NMR spectra were identical with those of an authentic sample.

(3aRS,6aRS)-3a-Bromo-3-methoxy-6a-methyl-3a,4,5,6a-tetrahydrofuro[3,2-d]isoxazole (17a). A solution of compound 3a (1.6 g, 10 mmol) in tetrachloromethane (10 ml) was treated under reflux with NBS (a total of 1.8 g, 10 mmol) and benzoyl peroxide (50 mg) over a period of 2 h. Each of the reagents was added in four equal portions every 30 min, and 30 min after the addition of the last portion of the reagents the reaction mixture was filtered and evaporated to give crude 17a. CC [eluent: toluene–ethyl acetate (3:1)] gave 17a as an oil. Yield: 1.7 g (70%). Almost the same yield was obtained by treatment of compound 3a in tetrachloromethane with excess of bromine for 6 days at room temperature. Anal. C₁₉H₂₄BrN₂O; C, H, N. Found: Br 35.37; calc. Br 33.83. IR (film) 2990–2880 (several bands, w), 1620 (s), 1450 (s), 1380 (s), 1365 (s) cm⁻¹. ¹H NMR (250 MHz, CDCl₃): δ 4.0 (1 H, t, J 0.8 Hz, J 7.7 Hz, J 9.1 Hz), 3.9 (3 H, s), 3.7 (t, J 4.7 Hz, J 12.1 Hz, J 9.1 Hz), 2.8 (1 H, t, J 0.8 Hz, J 4.7 Hz, J 12.8 Hz), 2.5 (1 H, t, J 7.7 Hz, J 12.1 Hz, J 12.8 Hz), 1.7 (3 H, s). ¹³C NMR (62.9 MHz, CDCl₃): δ 165 (C-3), 118 (C-6a, s), 66 (C-5, t), 63 (C-3a, s), 58 (O-CH₃, q), 41 (C-4, t), 23 (C-CH₃, q), J (C-5, H-5) 150 Hz, (O-CH₃, H-8) 148 Hz, (C-4, H-4), 138 Hz (C-CH₃, H-7) 129 Hz.

Inhibition of GABA₄ receptor binding. The ³H-GABA binding assay was performed with rat brain synaptic membranes as described previously in detail. Aliquots of synaptic membranes (0.8–1.2 mg of protein) were incubated in triplicate at 2°C in 2 ml of Tris–citrate buffer (pH 7.1) containing 5 nM ³H-GABA. Test substances were added in various concentrations. The samples were incubated for 15 min at 2°C followed by centrifugation. The pellets were rinsed twice with 5 ml portions of cold water and suspended in water (0.4 ml). IC₅₀ values were estimated by measuring the inhibition with at least four different concentrations. Non-specific binding in the presence of 1 mM GABA was subtracted.
